

Technical Assessment

AI Automation with n8n | Client Interaction & AI Development

Role	Client Interaction & AI Development
Time allowed	72 hours from the time this document is shared
Submit to	apjdigitalsolutions4u@gmail.com
Tools	n8n (free cloud trial or self-hosted), any AI model provider, Google Sheets, Gmail

Before you begin

This task is intentionally demanding and is not expected to be completed in full by most candidates. We are assessing how you approach an unfamiliar tool under real conditions, not whether you already know n8n. A partial submission with honest, clear notes is valued more highly than a polished copy of a tutorial.

You may freely use documentation, YouTube, forums and AI assistants. You must, however, be able to explain every part of what you submit.

The scenario

A clinic is one of our clients. Enquiries arrive through their website form, and each one currently has to be read, classified and replied to by hand. They want this automated, with a human approving anything sensitive before it reaches the patient.

Build this automation in n8n. The stages below increase in difficulty. Complete as many as you can, in order.

Stage 1 — Capture and store

- Create a webhook or form trigger that accepts: name, phone, email, enquiry text.
- Validate the incoming data. Reject the request with a clear error message if the name or phone is missing, or if the phone number is not a valid 10-digit Indian number.
- Append every valid enquiry to a Google Sheet with a timestamp.

Stage 2 — AI classification

- Pass the enquiry text to an AI model and have it return **structured JSON only**, containing: category (appointment / billing / medical_query / complaint / other), urgency (high / medium / low), and a one-line summary.
- Parse that JSON inside n8n and write each field into its own column in the sheet.
- Handle the case where the model returns malformed JSON or wraps it in code fences. The workflow must not crash.

Stage 3 — Conditional routing

- Route by category and urgency, not by a single condition:
 - — **medical_query** or **complaint**: do not auto-reply. Send the summary to a staff email for manual handling.
 - — **appointment** or **billing**: generate a personalised reply using the patient's name and their actual question, then email it to them.
 - — **high** urgency, any category: additionally send an immediate alert notification, regardless of the route taken above.

- Write the action taken back into the Google Sheet row for that enquiry.

Stage 4 — Grounding and error handling

- The AI must only answer using the clinic's real information. Create a second sheet or document holding clinic details (timings, services, consultation fees, address) and make the workflow read from it before generating any reply.
- If a patient asks something not covered by that information, the reply must say so and offer a callback. It must not invent an answer.
- Add error handling: if the AI node or the email node fails, the workflow should retry once, and if it still fails, log the failure to a separate sheet rather than dying silently.

Stage 5 — Stretch (optional)

- Prevent duplicate processing if the same enquiry is submitted twice within 10 minutes.
- Add a daily scheduled summary at 9:00 AM listing yesterday's enquiries by category.

What to submit

- **Exported workflow JSON** from n8n.
- **Screen recording (5-8 minutes)** showing the workflow running end to end, including at least one case that takes the manual-handling route.
- **A written note (one page maximum)** covering: which stages you completed, what defeated you and why, what you would do differently with another week, and which parts you needed outside help for.
- **A presentation deck** for the final round, as described below.

The written note carries real weight in our assessment. Be accurate about what you did and did not manage on your own.

Final round — Presentation to HR

Whatever you manage to build, you will be asked to present it. This round is held live and carries significant weight. You are presenting to someone who is **not** technical, exactly as you would to a paying client.

Prepare a short presentation (6-8 slides, 8-10 minutes) and be ready to take questions for a further 10 minutes.

Suggested slide structure

- **The problem** — what the clinic was struggling with, in plain language.
- **Your solution** — what you built, explained without technical jargon.
- **How it works** — walk through the flow visually. Use a diagram or screenshots, not code.
- **A live example** — one enquiry followed from arrival through to the reply.
- **What it saves** — time, cost or errors avoided. Give your own estimate and say how you arrived at it.
- **What is not finished** — be straightforward about the limits of what you built.
- **What you would build next** — and roughly how long it would take.

What we are looking for

- Can you explain a technical system to a non-technical person without either confusing them or talking down to them?
- Do you talk about the client's benefit, or only about the tools you used?
- How do you respond when questioned or challenged on something?

- How do you handle a question you do not know the answer to?

Slides should be clean and readable, not dense. Do not read from them. If your workflow is incomplete, present what exists honestly and explain the gap. Overstating what you built is the one thing that will count heavily against you.

How this will be assessed

Criteria	Weight
Working output — how far the workflow actually runs	25%
Problem solving — handling of errors, edge cases and bad data	20%
Presentation — clarity, structure and non-technical explanation	30%
Handling of questions and challenges during the presentation	10%
Honesty and self-awareness about gaps and outside help used	15%

Only 25% of the assessment rests on how much you finished. Communication carries the largest share, because this role involves explaining our work to clients every day.

Questions

If any part of the requirement is unclear, write to us. Asking a sensible clarifying question before starting is regarded positively, not negatively.
